                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GCTTCGGGGGGA 23
                                                                           was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hint end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWDA2 (gil4732114 [gb]AF129072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

The invention relates the identification of genes whose expression CC levels are altered by chronic exposure to one or more drugs of abuse CC (e.g., ethanol, stimulants, opiates). The methods of the invention CC monitor the response of a cell to a drug of abuse, and comprise CC contacting the cell with the drug of abuse, and detecting the expression of the contacting the cell with the drug of abuse, and detecting the expression for CC probes that specifically hybridise to the ESTs. The methods are used to CC identify genes whose expression levels are altered ky chronic or acute whose regulation is altered in alcohol tolerance and/or addiction CC whose regulation is altered in alcohol tolerance and/or addiction CC useful in designing therapeutic and recovery regimens, and in evaluating the susceptibility of an organism or patient to drugs in a medical CC context. Monitoring the expression of identified genes and/or ESTs CC provides a mechanism by which test agens can be screened for the ability to alter or modulate the response of the organism to drugs of abuse. CC gramers used to amplify 4 cDNA hybridisation probes from SH-SY5Y-AH1861 cnmarroblastoma cell total RNA. The probes were used in Northern CC blot analysis of gene expression in control and ethanol-treated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                문

The genes whose expression was analysed were dopamine beta-hydroxylase (DBH and sodium- dependent norepinephrine transporter (NTT), both of which a involved in norepinephrine metabolism; delta-like protein (DLK); and monocyte chemoattractant peptide 1 (MCP-1). These genes are thought to be important targets of ethanol, Primers AAZ59948-Z59949 were used to generate the delta-like protein (DLK) probe.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high mclar excess. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
Laboratory Mouse NAM RESOURCE (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymerase and T4 polymeride were polymuclectide kinase. Adaptor oligonucleotides were polymuclectide with T4 DNA polymerase and T4 polymuclectides were polymuclectide with T4 DNA polymerase and T4 polymuclectide were polymuclectide with T4 DNA polymerase and T4 polymer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT

The present invention relates to a member of the family of proteins known CC as ADAMTS (A Disintegrin And Metalloproteas Thrombospondin domain) CC proteins, the new member being designated ADAMTS-SI, antibodies to polynucleotides encoding ADAMTS-SI, assays for determining CC assays for studying the function of ADAMTS-SI, assays for determining CC assays for studying the function of ADAMTS-SI, and to the use of ADAMTS-SI assays for determining CC apolypeptides or polynucleotides in diagnostic, biotherapeutic, or gene CC therapy methods. ADAMTS proteins and ADAMTS protein agonists and CC antagonists are useful in the manufacture of a medicament for treating CC asthmat, chronic obstructive pulmonary disease, Alzheimer's disease, organ transplant toxicity and rejection, cachexia, allergy, cancer (such as solid tumour cancer including colon, breast, lung, prostate, brain, and CC haematopoietic malignancies including leukaemia and lymphoma), tissue ulcerations, restenosis, periodical disease, epidermolysis bullosa, cateoporosis, loosening of artificial joint implants, atherosclerosis consensative heart failure, myocardial confirmation, stroke, cerebral ischemia, head trauma, spinal cord injury, contingent of disease, parkinson's disease, migraine, dapression, coular anglogenesis, corneal injury, macular degeneration, occupantion enhancement, amyotrophic lateral sclerosis, multiple sclerosis, coular anglogenesis, corneal injury, macular degeneration, abnormal wound healing, burns, infertility or diabetic shock. This polynucleotide expression of ADAMTS-SI in chondrocytes derived from osteoarthritic (OA) cartilage and induction by proinfilammatory cytokines.

Designing capture oligonucleotide probes for use on a support complementary oligonucleotides hybridize with little mismatch

Fig 25; 300pp; English

C(I) have melting temperatures within a narrow range. The method is useful CC (I) have melting temperatures within a narrow range. The method is useful CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and CC Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, CC Epstein-Barr virus and pollo virus, and parasitic infectious agents CC selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus CC medinesis. The method is also useful for detecting genetic diseases such CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the CC cancer is specifically associated with a gene selected from BRCA1 gene, CC p33 gene, human papillomavirus types 16 and 18 and liver cancers. The CC method is also used for environmental monitoring, forensics and the food cand feed industry, detecting comprises scanning (using e.g. a scanning CC electron microscope and infrared microscope) the support at the comparative and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to of the present invention. The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (II) have melting temperatures within a narrow range. The method is useful of the present invention.

This sequence lies within an annotated exon of 300 bases of the 3' end of At1950000.

Class: TDNA tagged.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Arabidopsis Genome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pNB42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Biomedical

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      where the diagnostic method is an immunological method such as immunoblotting, serological tests or EIISA (enzyme linked immunoabsorbant assay). LppQ DNA and protein are useful for the preparation of a vaccine against infection by M. mycoides subsp. mycoides SC. LppQ DNA is useful for the preparation of live, attenuated or inactivated cells of M. mycoides subsp. mycoides SC to be used as marker vaccine, where the cells lack the ability to synthesise the LppQ lipoprotein. LppQ DNA is also useful for expressing LppQ protein in a detection method for M. mycoides subsp. mycoides SC, where the detection method is selected from PCR and hybridisation. LppQ protein is useful for detecting antibodies directed to it in a body fluid such as serun or bronchial fluid from an animal. LppQ protein are also useful as a specific antigen for sero-detection of contagious bovine pleuropneumonia (CBPP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a PCR primer used for site directed mutagenesis (to exchange Mycoplamsa specific UGARTTP codons to universal UGGTP codons) of lipoprotein LppQ gene from Mycoplasma mycoides subsp. mycoides SC (small colony type). LppQ is useful in a diagnostic method for the direct or indirect detection of M. mycoides subsp. mycoides SC, for the direct or indirect detection of M. mycoides subsp. mycoides SC,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel protein LppQ of Mycoplasma mycoides subsp. mycoides SC, parts useful for detection of Mycoplasma and for preparation for treating infection caused by Mycoplasma
                                                                                                                                                                                                                                                                                                                                                                             12-JUL-2000; 2000EP-0202472.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human and mouse alpha-catenin polypeptides and their associated polynucleotides. The polypeptides and related antibodies are useful for modulating the cadherin-catenin related pathway in selected organs, such as the heart and testis. The nucleic acids and the antibodies are useful in the diagnosis and/or prediction of the likelihood of developing cadherin-catenin related diseases. The nucleic acids may also be used to predict the likelihood of developing cancer or in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic acid or the antibody is useful in manufacturing a medicament for treating cacherin-catenin related diseases, such as cancer, cardiomyopathy, and male infertility. Sequences apscifically dilated cardiomyopathy, and male infertility. Sequences ABK41510-ABK41599 represent PCR primers used to amplify DNA encoding human and mouse alpha-catenin polypeptides, including the CTNNA3 gene which encodes human alpha T-catenin.
                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing a subject at the risk for or having Alzheimer's disease comprises determining at least one single nucleotide polymorphism in mitochondrial DNA associated with the disease in the sample from the

```

The present invention describes a novel method for determining the risk of or disgnosing Alzheimer's disease using single nucleotide polymorphisms (SNPs) present in an individual's mitochondrial DNA (mtDNA). In additon, the SNPs identified can be used to identify agents suitable for use in treating Alzheimer's disease. Sequences AAC67301-C67610 are PCR primers used to demonstrate the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (9g|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E: coli XL10-Gold (Stratagene) cells and selected for ampicilin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-vine stains, Sturge weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Meber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour anglogenesis is treated by administering (I) to the patient in confunction with one or more of other therapies such as radiation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthitic; antipsoriatic; virucide; osteopathic; ophthalmological; antiarthitic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Eming's Barcoma; melanoma; psoriatei; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss; Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;

(I) is useful for reducing ERG activity in cell, by contacting the cell with (I). (I) is useful for cleaving R ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool texamine genetic drift and mutations within diseased cells or to det the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion gen ABK17354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, related PCR primers of the invention.
                                                                                                        AAQ90137 and AAQ90138 are a pair of primers for the PCR amplification of the transthyretin (TTR) gene exon 2. They were used in a PCR-SSCP analysis for the identification of the TTR mutation Gly6 to Ser6. This mutation, as a genetic marker for familial Alzheimer's disease, is useful for identifying people at risk of developing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agazose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gil 4732114 [gb | AF129072:1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for amplicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Biomedical Polymers Research Bldg.,

                                                                                                                                                                                                                                                                Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting and quantifying fungi and bacteria, involves obtaining a sequence of the fungus, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction and fluorescent probe
                                                                                                                                                                           25-OCT-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              more cytokines or functional derivatives or agonists of one or more cytokines for a functional derivatives or agonists of one or more cytokines for a time and under conditions to ameliorate the effects of or to delay onset of cancer. The present sequence represents a PCR primer which amplifies the cDNA from breast cancer tissue. The cytokines can inhibit the growth of breast cancer cells and also detrimentally affect cell morphology.
                       The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (II)-2R gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AAV94575 to AAV94574 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor.
                                                                                                                                                                                            Ribozymes targeted to interleukin 2 - us cancer, autoimmune disease and allergies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; IL-2 receptor g-chain; interleukin 2 receptor gamma chain; hammerhead ribozyme; hairpin ribozyme; substrate; expression; can autoimmune disease; psoriasis; allergy; inflammatory disease;

The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making smal insert libraries for whole genome shotgun sequencing projects. Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barrell, Oxford University Press, 1999).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
```

```
The invention relates to a nucleic acid molecule which down regulates compression of a CD20 gene and a nucleic acid molecule which down compression of a neurite growth inhibitor gene (NOGO).

CC The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CD nazyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a CD nazyme) an Inozyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with an Angulation and inflammatory arthropathy. The CD20 targetting concleic acid is used to cleave RNA of the NGCO gene in the presence of a cliving and inflammatory arthropathy. The NGCO-targetting concleic acid is used to cleave RNA of the NGCO gene in the presence of a cliving and inflammatory arthropathy. The NGCO-targetting concleic acid is used to cleave RNA of the NGCO gene in the presence of a cliving a patient having a condition associated with the level of NGCO. The treat a patient having a condition associated with the level of NGCO. The treatment may further comprise the use of one or more therapies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNAzyme; inozyme; G-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; HHI; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHI; mantie-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; muitiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia,

                                              PCR primers AAV23717-32 were used during the course of the invention. The specification describes Pseudomonas pseudoalcaligenes lipase variants. The variant lipases described in the specification has have better wash performance than the original lipase. It has improved removal of lipid stains, reduced calcium dependence, better compatibility with detergents or their components, increased hydrophobicity, altered substrate specificity and better one-cycle wash efficiency. The variant lipase is used in detergent and cleaning compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA stroke). Alzheimer's disease, dementia, multiple selerosis (NS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is a zinzyme molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lipase; variant; improved wash performance; removal; lipid stain; reduced calcium dependence; one-cycle wash efficiency; detergent; cleaning composition; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           quality sequence stop: 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWP42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a recombinant DNA construct of a plant (Arabidopsis thaliana) centromers. The constructs are useful for producing stably inherited michrosomes which can serve as vectors for the construction of transgenic plant and animal cells expressing selected proteins such as hormones, enzymes, interleukins, clotting factors, cytokines, antibodies, and growth factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant DNA construct comprising a plant centromere, producing stably inherited michrosomes which can serve at the construction of transgenic plant and animal cells -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates (b) a primer designed based on the chromosome marker completel plates; (b) a primer designed based on the chromosome marker completel plates corresponding to the marker is detected from the resultant complified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell complates; (e) the clones are mixed respectively in each wells of longitudinal cand lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell complates are specified from the detected result; and (i) the clones are mixed products and staged. The mixed products are the positions on the chromosome and arrayed. The nitroarray is useful for gene analysis. ABI42357 to ABI46332 represent

The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi[4732114]gb[AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-completent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GTTGCTTCTATGG 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 Kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                   CC oligonuclectide probes (I) for use on a support to which complementary CC oligonuclectide probes (II) will hybridise with little mismatch, where CI have melting temperatures within a narrow range. The method is useful CC for detecting infectious diseases caused by bacterial infectious agents e.g. Cryptococcus necformans, Candida albicans and CC infectious agents e.g. Cryptococcus necformans, Candida albicans and CC Aspergillus fundgautus, viruses e.g. T-cell lymphocytotrophis cirus, CC Epstein-Barr virus and polio virus, and parasitic infectious agents CC medinesis. The method is also useful for detecting genetic diseases such CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. CC etecting cancer involving oncogenes, tumour suppressor genes, or genes cinvolved in DNA amplification, replication, recombination or repair, the CC cancer is specifically associated with a gene selected from BRCA1 gene, CC method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the CC sets occurred and correlating (using if lyation of the oligonucleotide probe genes or absence of the target nucleotide sequences. ABIS2074 to affect in present inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ś
                                                                                                                      The sequence shows an upstream PCR primer for in vitro amplification of bovine microsatellite sequences obtd. by screening library of bovine MboI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-thybridsed. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TS)n > microsatellites in the bovine genome is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). For each such microsatellite sequence sufficient information was obtd. to microsatellites microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                               (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwh92 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coil XL10-Gold (Stratagene) cells and selected for ampicillin resignance."

One such neurotoxin is alpha-cobratoxin from Naja naja siamensis (Thailand cobra). The present sequence is a PCR primer which was used to amplify alpha-cobratoxin cDNA for use in the present invention.
                                                                                                                                                                                                                                                           Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Composition for preventing HIV infection of mammalian cells comprises an anti-immunodeficiency virus immunokine capable of binding to a cellular protein by which HIV infection of the cell is prevented -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2001-616350/71.

The present invention describes a method of arraying genome clones. The CC multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (a) a primer designed based on the chromosome marker contained in the clones is added to the mixture to carry out an amplification resultant confided product to specify the discrimination Nos. of the multiwell confided product to specify the discrimination Nos. of the multiwell confided product to specify the discrimination Nos. of the multiwell confided plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell confided; (e) the clones in the multiwell plates of the specified confided and lateral directions; (f) the maximum the absorbance of longitudinal and lateral directions; (f) the mixed clones are cultured and the created from the amplified by using the above primer; (g) signals created result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. The creonestituted as the positions on the chromosome and arrayed. The creonestituted as the positions on the chromosome and arrayed. The constitutes for human chromosome 1936-35 NNA, and ABL45322 represent pCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention.

Direct Submission

Submitted (10-DEC-2000) Trypanosoma brucei genome sequencing project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton, Cambridge CBI0 1SA, E-mail: barrell@sanger.ac.uk and nhl@sanger.ac.uk and constructed at the Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucesi (TREU927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (

4 kb). The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barrell, Oxford University Press, 1999).

This EST fragment was amplified from cDNA Library of human CD 34+
stem/progenitor cells with GLGI technique (Generation of Longer
CDNA fragments from SAGE tags for Gene Identification, Proc. Natl.
Acad. Sci. USA 97, 349, 2000), which starts from the 3' end till
the first CATG site of the target cDNA sequence.
Seq primer: Ml3 Forward.

                                                                                                                                                                                                                                                  comprises deter DNA variant, eq disequilibrium
       The present invention describes a method (M1) of determining an individual's predisposition to epilepsy and/or development of epilepsy, as well as predicting the individual's response to medication. The method comprises determining the genotype of at least one gene selected from SCNIA, SCNZA or SCN3A, or a DNA variant, equivalent, or mutation which shows a linkage disequilibrium. SCNIA, SCNZA and SCN3A are all sedium channel genes located on chromosome 2. The idiopathic generalised epilepsy (IGE) gene is more specifically localised on chromosome 2q23-q31. Compounds identified as modulators of the biological activity of SCN1A, SCNZA or SCN3A proteins or genes, are useful for treating epilepsy or other neurological disorders. They have anticonvulsant and
                                                                                                                                                                                                                                                                                                                                     WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of detecting and quantifying fungi and bacteria, involving obtaining a sequence of the microorganism to be detected and quantified, extracting the DNA from the sample, and subjecting the DNA to polymerase chain reaction (PCR) and fluorescent probe analysis. The method is useful for identifying and quantifying specific fungi and bacteria using specific DNA sequences. The specific DNA sequences are useful for the real time detection of PCR products with a fluorogenic probe system or other molecular probes like hybridisation. ABK29026-ABK29474 represent fungal and bacterial PCR primers and probes used in the method of the invention.
                                                                                                                                                                                                              Example 5; Fig

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
transetted to the human Nck-2 gene, which inhibit the expression.

CC The antisense oligonucleotides were designed to target different

CC regions of the human Nck-2 mRNA, and were analysed for their effect on

CC Nck-2 mRNA levels by quantitative real-time PCR. Nck-2 (also known

CC as Nck adapter protein, hNck-beta and Grb4), contains both SH2 and SH3

CC arc homology domains and functions as an adapter protein in

CC integrin-mediated and receptor tyrosine kinase-mediated signal

CC transduction, particularly in growth factor receptor signalling.

CC Moreover, Nck-2 participates in pathways that connect growth factor

CC receptor signalling and integrin signalling via its interaction with

CC integrin, growth factor and Wnt signalling val its interaction with

CC integrin, growth factor and Wnt signalling pathways. Nck-2 also

CC interacts with EGF (epidermal growth factor) and PDGF-stimulated DNA

CC growth factor) receptors, inhibiting EGF- and PDGF-stimulated DNA

CC v-Abl, Ras and Sos proteins to induce transcriptional activation, and is

CC therefore implicated in the development of cancer, particularly leukaemia

CC and breast cancer. The oligonucleotides of the invention are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   source
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pirect Submission
Submitted (10-DEC-2000) Trypanosoma brucei genome sequencing
Submitted (10-DEC-2000) Trypanosoma brucei genome Campus, Hinxton,
project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton,
Cambridge CB10 1SA, E-mail: barrell@sanger.ac.uk and
nhl@sanger.ac.uk
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to give a tight size distribution (
4 kb). The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barrell, Oxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hall, N., Bowman, S., Lennard, N.J., Doggett, J., Atkin, R., Chillingworth, C., Ormond, D., Harris, B., El-Sayed, N., Hou, L., Melville, S.E., Rajandream, M.A. and Barrell, B.G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Trypanosoma brucei

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwd42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

The RNA molecules are complementary to a substrate binding region in the specified gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERMS interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 1993-386599/48

                                                                                                                                                                                                                                                                                                                                                                                                                       Hydronephrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                 STS probe GV10
This primer is used for the generation of sequence tagged sites (STS) probes used for pinpointing chromosome 6 breakpoint. This was used fo isolating the human hydronephrosis (HNG) gene of the invention. A translocation partner to this HNG gene on chromosome 6 is the chromosome 19 USF2 gene. The HNG gene can be used as a starting point
                                                                            Example 3;
